Generative AI Project Proposal: TECH 6100

Project Title:

Shards of the Force: An AI-Generated Star Wars Trailer

Project Overview:

Shards of the Force is an AI-generated cinematic trailer inspired by the Star Wars universe. It follows Seren Valis, a newly imagined Jedi Knight who discovers an ancient Force relic on the planet Vaelora. The project combines AI-generated text, imagery, and audio/video to produce a concept trailer approximately one to two minutes in length.

The goal of this project is to demonstrate how generative AI tools can work together across multiple modalities, including writing, visual design, and sound in order to create an immersive storytelling experience.

Upon completion, the final video will be uploaded to my personal YouTube channel for public viewing, and a shareable YouTube link will be provided as part of the project submission.

Selected AI Modalities & Integration Plan

1. Text Generation (Script & Narrative Design)

- **Tool:** ChatGPT
- **Purpose:** Generate the story outline, character profiles, dialogue, and voice-over narration script.
- **Integration:** The narrative text will guide image prompts, voice tone, and the sequencing of the final video.

2. Image Generation (Concept Art & Visual Storyboarding)

- **Tools:** Bing Image Creator (DALL-E 3) and Leonardo.ai
- **Purpose:** Create cinematic concept art of key scenes, the planetary environments, Jedi character designs, and mystical relics.
- **Integration:** Generated images will be used for both the visual storyboard and final video scenes.

3. Audio Generation (Voice-Over & Music)

- **Tools:** ElevenLabs and Mubert
- **Purpose:** Generate realistic narration and original orchestral-style music to match the cinematic tone.
- **Integration:** Audio elements will be synchronized with visuals to enhance immersion and narrative flow.

4. Video Integration and Editing

- **Tools:** Pika Labs and CapCut
 - **Purpose:** Combine generated visuals, narration, and music into a cinematic trailer.
 - **Integration:** The final MP4 video will be rendered, uploaded to YouTube, and embedded via link in the final project submission.
-

Objectives & Expected Outcomes

1. **Demonstrate Creative Integration:** Showcase how multiple free AI tools can work collaboratively to produce a unified and cinematic narrative.
 2. **Explore AI's Role in Visual Storytelling:** Examine how generative AI can replicate professional film development techniques in a cost-free educational setting.
 3. **Evaluate Strengths and Limitations:** Reflect on the creative possibilities and technical constraints of AI tools in multimedia production.
-

Timeline & Milestones (Two-Week Schedule)

Week 1:

- Generate story concept, character profiles, and voice-over script using ChatGPT.
- Develop image prompts and produce initial concept art using Bing Image Creator and Leonardo.ai.
- Finalize the narrative script and shot list.

Week 2:

- Generate voice narration and music with ElevenLabs and Mubert.
 - Assemble visuals, narration, and music using Pika Labs and CapCut.
 - Finalize timing, render final MP4, and upload completed video to YouTube.
 - Prepare the written reflection and proposal submission, including the YouTube video link.
-

Required Tools & Resources

- **ChatGPT** – Narrative and dialogue generation.
- **Bing Image Creator (DALL-E 3)** – Concept art and environmental design.
- **Leonardo.ai** – Cinematic character and world-building visuals.
- **ElevenLabs** – Voice-over narration generation.
- **Mubert** – Background orchestral music generation.
- **Pika Labs** – AI-based video animation and transitions.
- **CapCut** – Video compilation and final editing.
- **YouTube** – Hosting and sharing the final cinematic trailer for submission.
